

Lecture 7 Live Problems

Assessing models. Setting up, interpreting, and fixing change equations.

Points toward lab manual pages: **Flow2 (and IG8)** (section L1 S6)

1. What is 800 metric gigatons in standard units?

2. **Carbon-14 in the atmosphere.** Consider the change equation

$$\frac{\Delta C}{\Delta t} = 7 - 0.00012 C.$$

If C (the amount of carbon-14 in the atmosphere) starts at 0 when $t = 0$, how does it change over time?
