

Lecture 8 Live Problems

An introduction to growth. Linear growth.

Points toward lab manual pages: **LG1, LG3, LG4** (section L2 S1)

TO DO: No live problems existed for Lecture 8 in 2025. The following section (LG1, LG3, LG4) works linear growth of a population, linear functions, and fitting a line. A natural live problem: from a small population table, compute a constant $\Delta P / \Delta t$, write $P(t) = P_0 + rt$, and sketch.

1. Linear growth. A population grows by the same amount each year. Fill in the table, write the change equation, and write the predictive equation $P(t) = \underline{\hspace{2cm}}$.

t (years)	0	1	2	3	4
P	120	135
