

Lecture digest *what did this week's lecture describe, and how did we model it?*

Full name:

Lecture number:

Name of TA:

1. The system. Describe, *in your own words*, the biological (or other scientific) system that was the biggest focus of the lecture. What things are being described by numbers? How do they affect each other, in a real-world sense? Not just “X makes Y go down”—instead, “Sharks eat tuna, decreasing the tuna population.” Note any subtle aspects of the system worth remembering.

2. The model. Describe the mathematical model being applied to this system. What are the state variables, and what are the parameters? What do the equations say?

3. Diagram. Draw a diagram of the model: state variables as boxes or circles, arrows for positive (+) and negative (−) influences. Mark any feedback loops.
